

Three-company pilot comparison

A compact evidence bridge from AI exposure to organisational readiness, operating delivery and subsequent market outcomes.

How to read the pilot

Exposure measures how vulnerable the existing revenue engine is to AI-led automation or pricing pressure. Readiness measures evidence of platform migration, domain moat, productivity conversion and management delivery. A high score on one axis does not cancel the other.

Important: every historical score was reconstructed on 9 September 2026 from dated official disclosures. This avoids pretending that we made the call in real time.

Readiness strengthened - by different routes

All three companies improved their reconstructed readiness score. Intellect entered with lower disruption exposure because of its product-led model. TCS built the strongest readiness evidence but retains high exposure to changes in effort-led services. Tata Elxsi improved, while its design-engineering revenue growth slowed.

FY26 exposure versus readiness

GOLD = exposure **TEAL** = readiness

The two-axis view prevents a simplistic AI winner/loser label: a company can be highly exposed and still execute a credible transition.

Narrative claims must meet measurable delivery

The operating bridge keeps unlike units separate. It will not combine INR and USD revenue series, and it does not treat platform revenue as AI revenue unless management reports that link explicitly.

Company	FY26 revenue bridge	Margin bridge	Additional operating evidence
Intellect Design Arena	+22.7%	-1.8 pp	Platform revenue +140.7%
Tata Consultancy Services	-0.5%	+0.7 pp	Employees -3.9%
Tata Elxsi	+0.8%	Not comparable	Growth slowed FY24-FY26

Company interpretation

INTELLECT	Product economics provide lower structural exposure. FY26 platform conversion is encouraging, though the margin bridge and unsegmented AI revenue warrant continued verification.
TCS	Readiness evidence is strongest, but the scale of its services model leaves material exposure. Revenue, margin and workforce movement must be read together.
TATAELXSI	Specialised engineering and design offer a domain moat. Slowing growth means the transition case still depends on measurable monetisation and delivery.

Current pilot conclusion

Operating evidence supports a differentiated transition story for each company, but no single metric is sufficient. The framework is most useful as a disciplined investigation queue, not a valuation shortcut.

Higher readiness did not guarantee immediate outperformance

Relative returns below compare each company with Nifty IT using adjusted closing prices. Positive means outperformance; negative means underperformance. The FY26 observation is only a three-month reading.

Company	FY23 12m	FY24 12m	FY25 12m	FY26 3m
INTELLECT	+46.5	-25.6	+9.0	-16.5
TCS	+0.5	-11.3	-14.0	-6.6
TATAELXSI	-15.4	-27.7	-0.5	-15.5

What we learned

The outcome record is mixed. Intellect’s FY23 and FY25 assessments were followed by relative outperformance, while FY24 and the short FY26 window were not. TCS underperformed in most complete windows despite improving readiness. Tata Elxsi was also mixed. This is evidence against presenting the score as a near-term price predictor.

A proper prospective validation begins only after the methodology and scores are frozen. Future observations should be appended without rewriting earlier scores.

Evidence and control notes

TCS FY23-FY26	TCS annual report and official Q4 results releases
Tata Elxsi FY23-FY26	Tata Elxsi official full-year results releases
Intellect FY23-FY26	Intellect official earnings transcript and investor decks
Market outcomes	Yahoo Finance adjusted-close observations; Nifty IT benchmark

Limits: three companies are not a universe-level validation. Reconstructed histories contain hindsight risk. Market outcomes do not establish AI causality. This material is informational and is not investment advice.
